DETAILED ACTION

1 The application of Sjonell for "Vehicle Collision Detector" filed on February 02, 2006 has been examined.

Claims 1-20 are pending.

Allowable Subject Matter

2 The following is an examiner's statement of reasons for allowance: The combined prior arts of record disclose or suggest a collision prevention detector to be mounted on a vehicle and method for monitoring of the preceding environment as well as the evaluation of distances and speeds of multiple preceding vehicles, there is provided in accordance with the invention a process for detecting and monitoring a number of vehicles, which process divides the preceding environment into a near zone and distant zone, wherein for the preceding vehicles, speed and/or distance to the monitoring vehicle are determined, and on the basis of the respective determined lane, speed and/or distance for the preceding vehicles their position with respect to the near zone or the distant zone are determined, wherein on the basis of the respective determined speeds and/or positions of the preceding vehicles the actual speed of the monitoring vehicle is adjusted.

Art Unit: 2612

3 However, the combined prior arts of record fails to disclose or suggest a collision prevention detector to be mounted on a vehicle and method, transmitting a sequence of transmissions of IR signals, whereby the signals are transmitted in sequences alternating between at least one at the right and to the left positioned LED, when both signals provide a return/reflected signal to an IR-receiver an object is determined as present within an area from the point where the transmitted signals intersect/cross, whereby the sequencing of signals makes it possible to position a return signal from the object, as one of the signals has to confirm the other signal to provide a warning signal, said detector further comprising: at least two sets of said LED's positioned to the right and to the left, whereby a first set detects objects in a near-field zone of the vehicle, and a second set beyond said first field in a far-field zone, a processor connected to said first and second sets for detection of near-and far-field zones and being provided the vehicle speed, and a comparator connected to or comprised in said processor, which compares the vehicle speed with a pre-determined loss of measured distance by measuring how fast the vehicle approaches said object by closing in from the far-field zone to the near-field zone, whereby an alarm is given through an indicator device mounted on said vehicle alerting a vehicle driver to pay attention to the closing in of an approaching object.

CONCLUSION

4 The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. The following cited arts are further to show the state of art related

to a collision prevention detector to be mounted on a vehicle and a method.

In the U.S. Patent of (6,377,167 B1) Judd et al. discloses detection systems for detecting the presence of an object in a monitored zone and, more particularly, to an infrared detection system using infrared signals at multiple frequencies to discriminate between light reflected from an object within the monitored zone and other light and having means to selectively vary the boundaries of the monitored zone.
